

Working with Block Volumes/detaching a volume.txt

Detaching a Volume

Detach a block volume from an instance.

When an instance no longer needs access to a volume, you can detach the volume from the instance without affecting the volume's data.

Caution

For volumes attached using iSCSI, we recommend that you unmount and disconnect the volume from the instance using `iscsiadm` before you detach it. Open the navigation menu and click Compute. Under Compute, click Instances.

In the Instance list locate the instance. Click its name to display the instance details.

In the Resources section on the Instance Details page, click Attached Block Volumes

Click the Actions menu (Actions Menu) next to the volume you want to detach, and then click Detach. Confirm when prompted.
